Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

- (Currently Amended) A method for managing a queue of packets using queue sets <u>data</u> <u>structures</u>, the method comprising:
 - allocating transforming a plurality of consecutive packets into a queue set data structure

 based on a target queue set data structure size, the plurality of consecutive packets
 being associated with the queue; and
 - performing a queuing operation on the queue set <u>data structure</u>, the queuing operation treating the queue set <u>data structure</u> as a single entity, such that the queuing operation is performed on each of the plurality of consecutive packets in the queue set <u>data structure</u>.
- (Currently Amended) The method of claim 1, wherein allocating transforming the plurality
 of consecutive packets into the queue set data structure further comprises:
 - determining a size of each of the plurality of consecutive packets;
 - allocating the plurality of consecutive packets to the queue set <u>data structure</u> based on a target queue set <u>data structure</u> size <u>according to the consecutive packet sizes</u>, the target queue set <u>data structure</u> size being approximate to a largest supported packet length of the queue.

3. (Currently Amended) The method of claim 1, further comprising:

determining a queue service interval for performing queuing operations on queue sets

<u>data structures</u> based upon a desired data rate and a target queue set <u>data structure</u>

size;

wherein performing the queuing operation on the queue set <u>data structure</u> related to the queue further comprises:

performing a first queuing operation on a first queue set <u>data structure</u> related to the queue,

delaying a period of time equivalent to the queue service interval, and performing a subsequent queuing operation on a second queue set <u>data</u> <u>structure</u> related to the queue.

4. (Currently Amended) The method of claim 3, wherein determining the queue service interval further comprises:

determining an average queue set <u>data structure</u> size for the queue sets <u>data structures</u>

over a period of time; and

adjusting the queue service interval based upon a difference between the average queue set <u>data structure</u> size and the target queue set <u>data structure</u> size.

(Currently Amended) The method of claim 1, wherein performing the queuing operation further comprises:

shaping traffic flow of the queue set <u>data structure</u> at a rate for transmission of data from the queue.

- (Original) The method of claim 1, wherein the queuing operation comprises at least one selected from a group consisting of: enqueue operation and dequeue operation.
- 7. (Currently Amended) The method of claim 1, further comprising:

determining that each queue set <u>data structure</u> of a plurality of consecutive queue sets <u>data structures</u> is the same;

using one representative queue set <u>data structure</u> to represent the plurality of consecutive queue sets <u>data structures</u>, a replication count of the queue set <u>data structure</u> being equivalent to the number of queue sets <u>data structures</u> in the plurality of consecutive queue sets <u>data structures</u>; and

performing a queuing operation on the representative queue set <u>data structure</u>, such that
the queuing operation is performed on each of the plurality of consecutive queue
sets <u>data structures</u>.

 (Currently Amended) A system for queue management using queue sets <u>data structures</u>, comprising:

a queue set <u>data structure</u> generator configured for <u>allocating transforming</u> a plurality of consecutive packets <u>into</u> a queue set <u>data structure based on a target queue set</u> <u>data structure size</u>, the plurality of consecutive packets being associated with a

queue, the queue set <u>data structure</u> generator further configured for generating a notification when a queue set <u>data structure</u> is ready for scheduling; and a scheduler communicatively coupled to the queue set <u>data structure</u> generator to receive the notification, the scheduler configured for performing a queuing operation on the queue set <u>data structure</u>, the queuing operation treating the queue set <u>data structure</u> as a single entity, such that the queuing operation is performed on each of the plurality of consecutive packets in the queue set <u>data structure</u>.

 (Currently Amended) The system of claim 8, wherein the queue set <u>data structure</u> generator is further configured for;

determining a size of each of the plurality of consecutive packets; and
allocating the plurality of consecutive packets to the queue set <u>data structure</u> based on a
target queue set <u>data structure</u> size <u>according to the consecutive packet sizes</u>, the
target queue set <u>data structure</u> size being approximate to a largest supported
packet length of the queue.

10. (Currently Amended) The system of claim 8, wherein the scheduler is further configured for determining a queue service interval for performing queuing operations on queue sets data structures based upon a desired data rate and a target queue set data structure size, performing a first queuing operation on a first queue set data structure related to the queue, delaying a period of time equivalent to the queue service interval, and performing a subsequent queuing operation on a second queue set data structure related to the queue.

5

11. (Currently Amended) The system of claim 10, wherein the scheduler is further configured for

determining an average queue set <u>data structure</u> size for the queue sets <u>data structures</u>

over a period of time, and adjusting the queue service interval based upon a

difference between the average queue set <u>data structure</u> size and the target queue set <u>data structure</u> size.

- 12. (Currently Amended) The system of claim 8, wherein the scheduler is further configured for shaping traffic flow of the queue set <u>data structure</u> at a rate for transmission of data from the queue.
- 13. (Original) The system of claim 8, wherein the queuing operation comprises at least one selected from a group consisting of: enqueue operation and dequeue operation.
- 14. (Currently Amended) The system of claim 8, wherein the queue set <u>data structure</u> generator is further configured for determining that each queue set <u>data structure</u> of a plurality of consecutive queue sets <u>data structures</u> is the same, and using one representative queue set <u>data structure</u> to represent the plurality of consecutive queue sets <u>data structures</u>, a replication count of the queue set <u>data structure</u> being equivalent to the number of queue sets <u>data structures</u> in the plurality of consecutive queue sets <u>data structures</u>, and wherein the scheduler is further configured for performing a queuing operation on the representative
